CYNBIT WEBSITE

Improvement Recommendations

Project: Cynbit Website Quality Audit
Website: https://www.cynbit.in/
Prepared by: Sohib | QA Testing Intern Assessment
Report date: 31 October 2026

Purpose. Translate observations identified during structured manual test execution and exploratory testing into actionable website improvements. This document is a recommendation plan, not evidence that fixes have been implemented.

1. Basis and QA context

Metric	Recorded result
Documented test cases	140
Recorded test execution	127 passed; 13 failed (90.7% recorded pass rate)
Reported findings	46 bugs and observations from structured and exploratory testing
Verification note	Some UI/content and performance observations still require reproduction or specification confirmation

2. Prioritized improvement plan

P1 - High | Input validation and form feedback

Areas: Contact inquiry, careers application and product demo

Recommendation: Trim whitespace-only required values; reject numeric-only names where unsupported; permit legitimate characters in names. Validate phone number characters and country-aware lengths. Validate email and portfolio URL formats on both client and server. Display clear field-level error messages, preserve entered data, and focus first invalid field.

Acceptance criteria: Invalid forms must not submit; compliant names, URLs and contact details must work; all error messages visible and keyboard accessible.

P1 - High | Filtering and empty-result behavior

Areas: Case Studies and Blog search

Recommendation: Confirm category filtering updates matching records; reset via All Success Stories; retain a visible active state. Search should show matching content, no-results feedback and a bounded loading state.

Acceptance criteria: Changing categories updates content correctly; empty and nonsense keywords produce stable, understandable responses.

P1 - High | Mobile overflow and clipping

Areas: Blog pagination, Homepage, BitElevate

Recommendation: Remove unintended fixed-width overflow and inaccessible clipped content. On narrow viewports, wrap or stack pagination controls and cards. Review 320px, 375px, 768px and 1366px layouts.

Acceptance criteria: All essential text and controls are fully visible or intentionally scrollable; no unreachable content.

P2 - Medium | Contact actions and navigation

Areas: Contact Us, Careers, CTA links

Recommendation: Confirm email links use mailto: and phone links use tel: with correct target data; ensure keyboard focus and activation. Verify intended destination and button behavior; distinguish plain text from actionable links.

Acceptance criteria: Clickable affordances lead to correct destinations; links work with compatible apps/devices.

P2 - Medium | Response time and feedback

Areas: Blog search and featured articles

Recommendation: Measure TTFB, navigation duration and loading state on repeatable network conditions. Optimize large assets and client work only after identifying bottlenecks; show progress or graceful timeout.

Acceptance criteria: Search and article navigation complete within an agreed performance target; no indefinite spinner or unresponsive UI.

P2 - Medium | Accessibility and readability

Areas: Brand labels, forms, pagination and cards

Recommendation: Measure foreground/background contrast against WCAG criteria; verify semantic labels, visible focus, keyboard tab order and understandable validation messages.

Acceptance criteria: Interactive controls are usable by keyboard; text and error states meet applicable contrast and accessibility requirements.

P3 - Low | Typography and visual polish

Areas: Hero headings, icons, cards and newsletter

Recommendation: Check purported clipped descenders and italic lettering at 100% zoom; normalize baseline/padding alignment. Compare capitalization with approved content style guide before classifying as defect.

Acceptance criteria: No actual glyph clipping; aligned form/button controls; consistent approved typography and brand treatment.

3. Suggested remediation order

Phase	Suggested action	QA verification
1 - Fix blockers	Form validation; category filters; inaccessible mobile controls	Repeat negative inputs, category switches, narrow viewports
2 - Improve reliability	Navigation targets, loading states, response-time investigation	Confirm link targets; measure repeatable network timings
3 - Polish experience	Contrast, typography, field markers and card alignment	Keyboard/contrast checks and visual regression across viewports

4. Retesting checklist and evidence

For each confirmed defect: retain Bug ID, exact URL, browser/OS, viewport, zoom, input data, reproduction steps, expected/actual behavior and original screenshot. After a fix, repeat the failed scenario, relevant positive scenarios, and adjacent regression checks. Mark findings as Closed only after a successful retest.

5. Important qualifications

Some findings reported during exploratory testing are potential issues rather than independently confirmed defects. Entering invalid data without triggering submission does not by itself prove failed validation. Capitalization, decorative card styles, font selection boundaries and laptop email/dialer integration can be intentional or environment-dependent. Verify these against product specifications and reproducible behavior before assigning defect severity.

6. Recommendation summary

Prioritize correctness and data quality first, followed by functional search/filter behavior and mobile content accessibility. Then address reliability, accessibility and visual consistency. These improvements should be validated against the Bug & Issue Report and linked screenshot evidence after remediation.
