CYNBIT WEBSITE QA AUDIT REPORT

Structured Manual Testing + Exploratory Testing

Project	Cynbit Website Quality Audit
Website	https://www.cynbit.in/
QA Tester	Sohib
Testing Approach	Test Case-Based Manual and Exploratory Testing
Report Date	31 October 2026

1. Executive Summary

A comprehensive Quality Assurance audit was conducted on the Cynbit website to evaluate functionality, usability, responsiveness, form validation, navigation, and the overall user experience.

The assessment combined structured test case execution with exploratory testing to obtain broader coverage beyond predefined scenarios. A total of 140 test cases were documented; the testing record lists 127 passed and 13 failed. Across both approaches, 46 bugs and observations were documented.

These figures describe the recorded assessment. Some design-related observations remain subject to verification against the intended behavior and approved design specification.

2. Testing Methodology

2.1 Test Case-Based Manual Testing

Predefined test cases were used to evaluate expected website behavior across its public modules.

- Functional testing
- Positive and negative testing
- Form validation testing
- UI and usability testing
- Responsive testing
- Navigation testing
- Compatibility and accessibility checks

2.2 Exploratory Testing

In addition to the documented test cases, exploratory testing was performed across website sections to discover issues not explicitly anticipated by test scripts.

- UI alignment, text clipping and responsive design inconsistencies
- Input validation and button/link functionality
- Search and filter behavior
- Page loading and performance observations
- Typography and content consistency

3. Test Execution Summary

Metric	Recorded Result
Total Test Cases	140
Passed Test Cases	127
Failed Test Cases	13
Test Case Pass Rate	90.7%
Total Reported Bugs & Observations	46
Testing Approaches	Structured Manual + Exploratory

4. Defect Summary

A total of 46 bugs and observations were documented through predefined test case execution and exploratory testing. The number of findings exceeds the number of failed test cases because exploratory investigation identified additional issues, and a single test scenario can reveal multiple defects.

Issues observed during the assessment included validation weaknesses, responsive layout concerns, filtering and navigation behavior, performance observations, and typography or usability inconsistencies. Certain findings require further verification before being classified as confirmed defects.

5. QA Conclusion

The Cynbit website was evaluated using structured manual testing and exploratory testing. This combined approach helped reveal functional, validation, responsive design, and usability concerns while preserving a record of expected-versus-observed behavior.

Confirmed defects should be prioritized according to severity and user impact. Unverified observations should be reviewed against design guidelines and retested before closure decisions are made.

Evidence & Reporting Note

Detailed test cases, recorded execution outcomes, bug descriptions, and available screenshot evidence are maintained in the separate Cynbit QA Testing workbook. The audit summary should be read together with that detailed evidence.
